

MODULAR PALLET

ABSTRACT OF THE DISCLOSURE

[0027] A pallet has a base member with a top surface defining first and second spaced apart openings near an edge of the top surface. Hollow legs extend downwardly from the bottom surface of the pallet and define a passageway below the bottom surface. Each hollow leg is a wheel well wherein a wheel is fastened to the base member. Each wheel inside its associated hollow leg extends downwardly from the base member to an elevation below the associated leg so that the wheel is free to support and move the base member. An inverted U-shaped handle has its bottom ends removably inserted in the first and second openings. Flanges attached to the bottom end portions of first and second upright members rest on the top surface of the pallet when the upright members are inserted.
